## Fuzzy Countries

*In this project a socioeconomical model of a variety of countries is developed.*

*The model is based on the fuzzy logic theory and it is implemented in Ciao Prolog using the RFuzzy library and Python using Sklearn to compare the results with a real dataset in order to find the credibility of the model. For the visualization of the results, Uflesse is used.*

# 1 Theoretical Framework

## 1.1 Fuzzy Logic

Fuzzy logic is a form of many-valued logic in which the truth values of variables may be any real number between 0 and 1 both inclusive. It is employed to handle the concept of partial truth, where the truth value may range between completely true and completely false. By contrast, in Boolean logic, the truth values of variables may only be the integer values 0 or 1.
